This table provides final 2017 and 2018 state-level data on drug overdose deaths involving opioids. Data are presented as counts (number of deaths) and age-adjusted death rates (per 100,000 standard population). The table also includes drug specificity data by state for 2018. Drug specificity—the percentage of drug overdose death records where at least one drug or drug class is recorded—serves as an indicator of data quality when comparing overdose death counts or rates for a specified drug or drug class.

¹Age-adjusted death rates per 100,000 standard population.

²Percentage of drug overdose death records in which a specific drug or drug class is identified.

NOTES: Deaths are classified using the *International Classification of Diseases, 10th Revision* (ICD-10). Drug poisoning (overdose) deaths are identified using underlying cause-of-death codes. This table reflects deaths for any opioids (ICD-10 codes T40.0–T40.4, T40.6). States vary in the quality of reporting of the specific drugs involved in a drug overdose death. If a state has poor reporting, the reported rate may appear lower than the actual rate.

SOURCE: NCHS, National Vital Statistics System.

This table presents the provisional number of drug overdose deaths by county of occurrence and county of residence, as well as the provisional death rate per 100,000 by county of residence for the 12-month period ending June 2019 in the United States. Death counts by county of residence or county of occurrence are provided for counties with 10 or more deaths. Rates by county of residence are provided for counties with 20 or more deaths.

^ Insufficient number of deaths to meet NCHS standards for confidentiality.

* Estimate does not meet NCHS standards of data quality.

NOTES: Provisional data may not include all deaths that occurred during a given time period. Therefore, they should not be considered comparable with final data and are subject to change. Death counts by county of residence or county of occurrence are provided for counties with 10 or more deaths, although any count of less than 10 deaths is suppressed. Rates by county of residence are provided for counties with 20 or more deaths. Population estimates used for computing rates are postcensal estimates for 2018 originated from the U.S. Census Bureau and are based on the 2010 census. Drug overdose deaths are identified using ICD-10 underlying cause-of-death codes: X40–X44, X60–X64, X85, and Y10–Y14.

Title: Percent of coronavirus disease 2019 (COVID-19) deaths occurring among race and Hispanic origin groups, United States.

Data as of 4/9/2020

Race and Hispanic Origin¹	Percent of COVID-19 Deaths
Hispanic	16.0
Non-Hispanic black	17.1
Non-Hispanic white	54.4
Non-Hispanic other race ²	12.6

NOTE: Percentages are based on deaths with confirmed or presumed COVID-19, coded to ICD-10 code U07.1. Percentages in this table are based on the total number of COVID-19 deaths (N=4,169) received and coded as of the date of analysis (4/9/2020) and do not represent all deaths that occurred in that period. The percentages in this table were calculated by dividing the number of COVID-19 deaths for each race and Hispanic Origin group by the total number of COVID-19 deaths. Percentages may not sum to 100 due to rounding. Data during this period are incomplete because of the lag in time between when the death occurred and when the death certificate is completed, submitted to NCHS and processed for reporting purposes. This delay can range from 1 week to 8 weeks or more. **The distribution of deaths involving COVID-19 by race/ethnicity shown on this table should not be compared to the race/ethnicity distribution of the U.S. population because COVID-19 deaths are concentrated in certain geographic locations where the racial and ethnic population distribution differs from that of the United States overall.**

¹ Race and Hispanic Origin is based on bridged-race categories (see: https://www.cdc.gov/nchs/nvss/bridged_race.htm).

² Includes Hispanic Origin unknown.

*Data during this period are incomplete because of the lag in time between when the death occurred and when the death certificate is completed, submitted to NCHS and processed for reporting purposes.

¹Deaths with confirmed or presumed COVID-19, coded to ICD-10 code U07.1.

²Deaths with confirmed or presumed COVID-19, Pneumonia, or Influenza, coded to ICD-10 codes U07.1 or J09-18.9.

³Percent of expected deaths is the number of deaths for all causes for this week in 2020 compared to the average number across the same week in 2017–2019. Previous analyses of 2015–2016 provisional data completeness have found that completeness is lower in the first few weeks following the date of death (<25%), and then increases over time such that data are generally at least 75% complete within 8 weeks of when the death occurred.

Percentages of Selected Mental Health Indicators for Adults Aged 18 and Over, by Age: United States, January–June 2019

In the table below, the National Center for Health Statistics (NCHS) National Health Interview Survey (NHIS) Early Release Program provides estimates for selected mental health indicators, disaggregated by age, based on data from the January–June 2019 NHIS. Estimates without disaggregation were released in May 2020 and are available online:

<https://www.cdc.gov/nchs/data/nhis/earlyrelease/ERmentalhealth-508.pdf>.

The indicators are based on self-report of the frequency of anxiety and depression symptoms. They are derived from responses to the first two questions of the eight-item Patient Health Questionnaire (PHQ-2) and the seven-item Generalized Anxiety Disorder (GAD-2) scale. In the PHQ-2, survey respondents are asked about how often in the last two weeks they have been bothered by 1) having little interest or pleasure in doing things, and 2) feeling down, depressed, or hopeless. In the GAD-2, survey respondents are asked about how often the respondent has been bothered by 1) feeling nervous, anxious, or on edge, and 2) not being able to stop or control worrying. For each scale, the answers are assigned a numerical value: not at all = 0, several days = 1, more than half the days = 2, and nearly every day = 3. The two responses for each scale are added together. The NHIS indicators in the table are the percentages of adults who had reported symptoms of anxiety or depression that resulted in scale scores equal to three or greater. These adults have symptoms that generally occur more than half the days or nearly every day.

Percentages (and 95% confidence intervals) of selected mental health indicators for adults aged 18 and over, by age: National Health Interview Survey, January–June 2019

Age group	Symptoms of anxiety disorder	Symptoms of depressive disorder	Symptoms of anxiety disorder and/or depressive disorder
Adults 18 years and over	8.2 (7.6–8.8)	6.6 (6.2–7.1)	11.0 (10.3–11.6)
18–34 years	10.0 (8.9–11.2)	5.8 (5.0–6.7)	12.2 (11.1–13.4)
35–49 years	7.6 (6.7–8.7)	6.0 (5.2–7.0)	9.9 (8.8–11.2)
50–64 years	8.0 (7.1–9.0)	7.0 (6.3–7.8)	10.7 (9.7–11.7)
65 years and over	6.4 (5.4–7.6)	7.9 (6.9–8.9)	10.6 (9.4–12.0)

NOTE: Data are based on household interviews of a sample of the civilian noninstitutionalized population. Percentages are based on responses to the GAD-2 and PHQ-2 scales. Adults with missing responses to one or both questions in the scale are not included in the calculation of the percentages.

These estimates are being published prior to final data editing and final weighting and provide benchmarks for recent mental health estimates derived from the U.S. Census Bureau’s Household Pulse Survey. The Household Pulse Survey is an experimental data system started in April 2020 to produce data on the social and economic impacts of COVID-19 on U.S. households. The Pulse Survey included similar questions on mental health, but the timeframe was limited to the last 7 days rather than the last 2 weeks. Unlike NHIS, the Pulse Survey is not a health survey; rather, it is framed as a survey about changes in finances, employment, health, and education due to coronavirus specifically. The Pulse Survey is administered via an online questionnaire, and its representativeness and potential biases have not yet been fully evaluated.

The table below provides estimates, disaggregated by age, based on data from the Household Pulse Survey. More information on mental health estimates from the Pulse Survey are available at: <https://www.cdc.gov/nchs/covid19/pulse/mental-health.htm>.

Based on Pulse Survey data from May 28-June 2, 2020, 35.5% of adults in the U.S. had symptoms of anxiety disorder and/or depressive disorder. Non-Hispanic black adults (40.5%) and Hispanic adults (38.3%) were significantly more likely to have these symptoms than non-Hispanic white adults (33.1%). For non-Hispanic black adults and non-Hispanic Asian adults, the percentages of symptoms of anxiety disorder and/or depressive disorder were significantly higher for May 28-June 2 compared with May 21-26 (40.5% compared with 35.6% for non-Hispanic black adults, 34.2% compared with 27.6% for non-Hispanic Asian adults). Provisional COVID-19 Deaths Among Ages 5-18 Years

Data as of 7/13/2020

Data are reported for deaths that occurred from the week ending February 1, 2020 through July 11, 2020. Data during this period are incomplete because of the lag in time between when the death occurred and when the death certificate is completed, submitted to NCHS and processed for reporting purposes. COVID-19 deaths are those with confirmed or presumed COVID-19, coded to ICD-10 code U07.1.

Limited information is available on the impact of SARS-CoV-2 (COVID-19) and the pandemic in general on pregnant women and their newborns. Using data collected on birth records, NCHS is monitoring a number of factors, including prenatal care, that could potentially be affected by COVID-19 and will report on these data as they become available. Anecdotal information suggests that pregnant women and/or healthcare providers may have cancelled or postponed prenatal care visits, thereby impacting the timing of initiation of care and the adequacy of care. The table below provides baseline data for selected prenatal care characteristics for January-April 2020, which includes the early months of the pandemic, and compares these data with corresponding data for 2019. NCHS will continue to track these, and other pregnancy-related factors over the coming months to identify changes that may be associated, either directly or indirectly, with the pandemic.

NOTES: Provisional data may not include all deaths that occurred during a given time period. Therefore, they should not be considered comparable with final data and are subject to change. Drug overdose deaths are identified using ICD-10 underlying cause-of death codes: X40-X44, X60-X64, X85, and Y10-Y14. Counts include deaths that occurred in the United States and may include non-US residents.

This table presents the percentage of drug overdose deaths involving a specific drug or drug class, for select jurisdictions. Jurisdictions were selected for inclusion if they met specific data quality thresholds (see Notes below table for information). From April 2019 to March 2020, 75.8% of drug overdose deaths in the United States involved opioids, 24.5% involved cocaine, and 25.3% involved psychostimulants with abuse potential. Categories are not mutually exclusive because deaths may involve more than one drug. Frequencies used in calculating percent of drug overdose deaths can be found on the [VSRR Monthly Drug Overdose Death Counts](#) page.

NOTES: Provisional data may not include all deaths that occurred during a given time period. Therefore, they should not be considered comparable with final data and are subject to change. Deaths are classified by the reporting jurisdiction in which the death occurred and include foreign residents. The percentage of drug overdose deaths involving a specific drug or drug class is defined by the predicted number of deaths involving a specific drug or drug class divided by the estimated total predicted number of drug overdose deaths with a drug mention for a jurisdiction. *Predicted* provisional deaths represent estimates of the number of deaths adjusted for incomplete reporting ([link](#)). The estimated total predicted number of drug overdose deaths with a drug mention is calculated by multiplying the predicted number of drug overdose deaths by the jurisdiction's percent of drug overdose deaths that mention at least one specific drug. Jurisdictions are selected for inclusion in this table if they have met the following three measures of data quality ((a) overall percent completeness of reporting ($\geq 90\%$), (b) the percentage of records pending investigation ($\leq 1\%$), and (c) the percentage of overdose deaths with drug specified ($\geq 80\%$)) from April 2019 to March 2020. Drug overdose deaths are identified using ICD-10 underlying cause-of-death codes: X40–X44, X60–X64, X85, and Y10–Y14. Drug overdose deaths involving selected drug categories are identified by ICD-10 multiple cause-of-death (MCOD) codes: heroin, T40.1; natural and semisynthetic opioids, including drugs such as oxycodone, hydrocodone, and morphine, T40.2; methadone, T40.3; synthetic opioids, including drugs such as fentanyl and tramadol and excluding methadone, T40.4; cocaine, T40.5; and psychostimulants with abuse potential, including drugs such as methamphetamine, T43.6. Opioid overdose deaths are identified by the presence of any of the following MCODE codes: opium, T40.0; heroin, T40.1; natural and semisynthetic opioids T40.2; methadone, T40.3; synthetic opioids, T40.4; or other and unspecified narcotics, T40.6. Categories are not mutually exclusive because deaths may involve more than one drug.

SOURCE: NCHS, National Vital Statistics System. Provisional mortality data from April 2019–March 2020.

The following table presents the percentage of drug overdose deaths with specified drugs (N=71,727) that mention two of the listed drugs or drug classes. For example, 2.2% of drug overdose deaths with drugs specified mention both heroin (T40.1) and natural & semi-synthetic opioids (T40.2) and may include additional drugs.

(see Page 2 for footnotes and additional information).

¹Percentage of deaths involving concomitant drug among deaths involving referent drugs. Concomitant drug mentions are mentions of multiple drugs involved in a death. Deaths may involve more than one concomitant drug in addition to referent drug. Deaths involving more than one drug (e.g., a death involving both heroin and cocaine) are included in both totals (i.e., as a referent drug and concomitant drug).

NOTES: Provisional data may not include all deaths that occurred during a given time period. Therefore, they should not be considered comparable with final data and are subject to change. The percentage of drug overdose deaths involving a specific drug or drug class is defined by the reported number of deaths involving a specific drug or drug class divided by the reported number of drug overdose deaths with a combination of drug or drug classes mentioned. Any combination of drug or drug classes mentioned may include deaths with additional drugs. Percentages should not be summed. Drug overdose deaths are identified using underlying cause-of-death codes from the Tenth Revision of ICD (ICD–10): X40–X44 (unintentional), X60–X64 (suicide), X85 (homicide), and Y10–Y14 (undetermined). Drug overdose deaths involving selected drug categories are identified by ICD–10 multiple cause-of-death (MCO) codes: heroin, T40.1; natural and semisynthetic opioids, including drugs such as oxycodone, hydrocodone, and morphine, T40.2; methadone, T40.3; synthetic opioids, including drugs such as fentanyl and tramadol and excluding methadone, T40.4; cocaine, T40.5; and psychostimulants with abuse potential, including drugs such as methamphetamine, T43.6.

This table shows the types of health conditions and contributing causes mentioned in conjunction with deaths involving coronavirus disease 2019 (COVID-19). For 6% of the deaths, COVID-19 was the only cause mentioned. For deaths with conditions or causes in addition to COVID-19, on average, there were 2.9 additional conditions or causes per death. The number of deaths with each condition or cause is shown for all deaths and by age groups. Values in the table represent number of deaths that mention the condition listed and 94% of deaths mention more than one condition. As such, the rows should not be summed. Additional notes are listed at the end of the table.

NOTE: Number of conditions reported in this table are tabulated from deaths received and coded as of the date of analysis and do not represent all deaths that occurred in that period. Data for this table are derived from a cut of the NVSS database taken at a particular time, separate from other surveillance tables on this page which are tabulated on the date of update. As a result, the total number of COVID-19 deaths in this table may not match other surveillance tables on this page. Data during the period are incomplete because of the lag in time between when the death occurred and when the death certificate is completed, submitted to NCHS and processed for reporting purposes. This delay can range from 1 week to 8 weeks or more. Conditions contributing to the death were identified using the International Classification of Diseases, Tenth Revision (ICD–10). Deaths involving more than one condition in conjunction with COVID-19 (e.g., deaths involving COVID-19, diabetes and respiratory arrest) were counted in both other conditions. To avoid counting the same death multiple times, the numbers for different conditions should not be summed. Deaths with confirmed or presumed COVID-19, coded to ICD–10 code U07.1.
