

Roadmap Reference	Comment Received	Response	Change to Roadmap
	<p>The science has been in place for a long time. It is time to inform and educate. 99% of the people I talk to have no idea they live with asbestos in their homes. We need PSA's and help in understanding why we should not cut into old materials and some cases new materials in our homes not just in the work place. They is more than enough science indicating the presence of asbestos and its health effects to warn people right now...NIOSH and the government has been irresponsible long enough regarding the hazards associated with asbestos... Why do we need more information? Why should more people die first? Who cares what type of asbestos is more deadly? People need information now so that we do not suffer latter. Let's try a proactive preventive approach...</p>	<p>The purpose of the <i>Roadmap</i> is to identify research gaps and scientific uncertainties associated with occupational exposure to asbestos and related minerals, and to develop a framework for research. Research conducted under the proposed framework would improve our understanding so that more effective recommendations that will help protect workers from disease can be developed.</p>	<p>No revision</p>
